

# Business Problem Statement

A leading ride-hailing company, OLA, wants to better understand its booking and ride performance to improve operational efficiency, customer satisfaction, and revenue. The management team has noticed variations in booking success, cancellations, customer and driver ratings, vehicle performance, and ride patterns across different locations and vehicle types. They are particularly interested in identifying the key factors that influence successful rides, cancellations, customer experience, and overall booking performance.

You are tasked with analyzing the OLA booking dataset to answer the following overarching business question:

**“How can OLA leverage its booking data to identify operational trends, reduce cancellations, improve customer experience, and optimize overall ride and revenue performance?”**

## Deliverables

- 1. Data Analysis (SQL):** Analyze OLA booking data to identify trends in bookings, cancellations, revenue, and customer behavior.
- 2. Visualization & Insights (Power BI):** Create an interactive dashboard to visualize key OLA performance metrics and business insights.
- 3. Report and Presentation:** Summarize the key findings and recommendations in a clear report and presentation.
- 4. GitHub Repository:** Upload the dataset, SQL queries, Power BI dashboard, and project documentation in a structured repository.
